

AI FLUENCY ROUND (90 MINUTES)

In this round, you will be given a product or engineering problem and will be expected to design and implement a solution using AI-assisted workflows where appropriate.

The problem may involve:

Designing and implementing a new feature/use case
Working on and improving an existing codebase
Making architecture, scalability, and tradeoff decisions

You are encouraged to use AI tools (for example: Codex, Claude, Cursor, ChatGPT, etc.) as part of your workflow. The focus of the evaluation is not whether AI is used, but how effectively you leverage it to solve problems, reason about tradeoffs, validate outputs, and drive execution.

Setup

You are encouraged to use their own development setup/environment for familiarity and efficiency. Candidates may use their preferred IDE, AI tooling, and local workflow during the interview.

You can submit / upload your work to your Git repository and share access to the interviewer

You are strongly encouraged to:

- Clearly decompose the problem before implementation
- Discuss tradeoffs and alternative approaches
- Be vocal about assumptions and constraints
- Validate and refine AI-generated code/designs instead of accepting them blindly
- Think about scalability, maintainability, observability, and failure handling

Please note that you'll be evaluated on the following aspects in this round:

- Problem Framing & System Thinking
- Ability to break down the problem, define clear interfaces/specifications, and design scalable systems with appropriate tradeoffs.

AI Collaboration & Adaptability

How effectively you use AI tools to explore solutions, iterate on ideas, ramp up in unfamiliar areas, and improve productivity while maintaining engineering judgment.

- Speed and quality of implementation
- Validation & Observability
